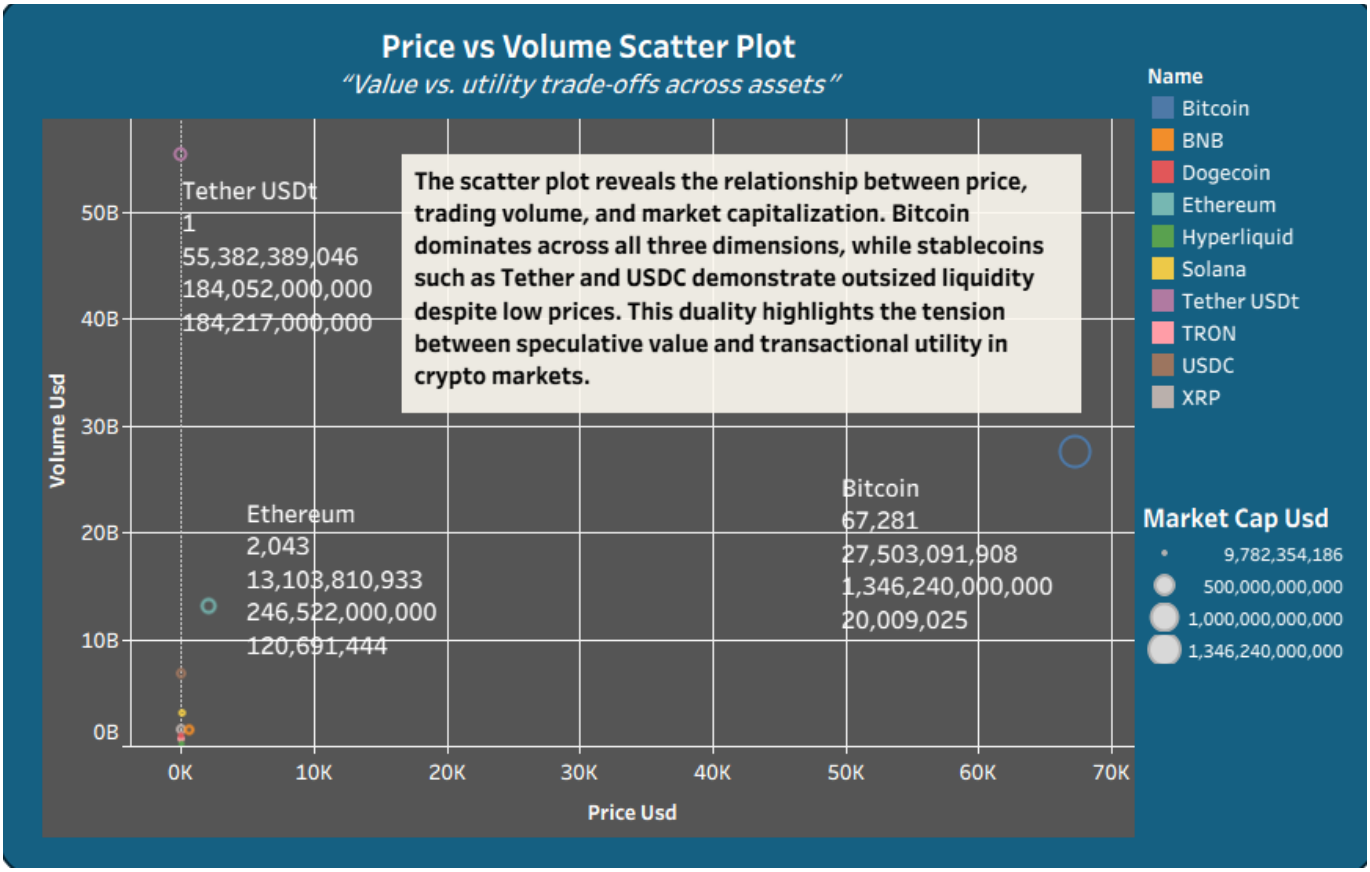
Crypto Analysis

- Price vs Volume

"Value vs. utility trade-offs across assets"

- **The Store of Value (Bitcoin):** It sits alone at the top right because it has the highest **Price** and largest **Market Cap** (the biggest bubble). It is the "Gold" of the market.
- **The Utility Engines (Tether & USDC):** These are on the far left. Their price is always **$1**, but their **Volume** is massive. This shows they are the "Oil" used to move money around the ecosystem.
- **The Infrastructure (Ethereum):** It sits in the middle. It has a significant price and high volume, acting as the bridge between "investing" (Bitcoin) and "trading" (Stablecoins).



❖ This chart proves that in crypto, **Value** (high price) and **Utility** (high trading volume) are two different things. Bitcoin holds the wealth, while Stablecoins power the transactions.

Supply Ratio Chart

"Scarcity and issuance maturity across major cryptocurrencies"

The "Finished" Coins (Bitcoin & BNB):

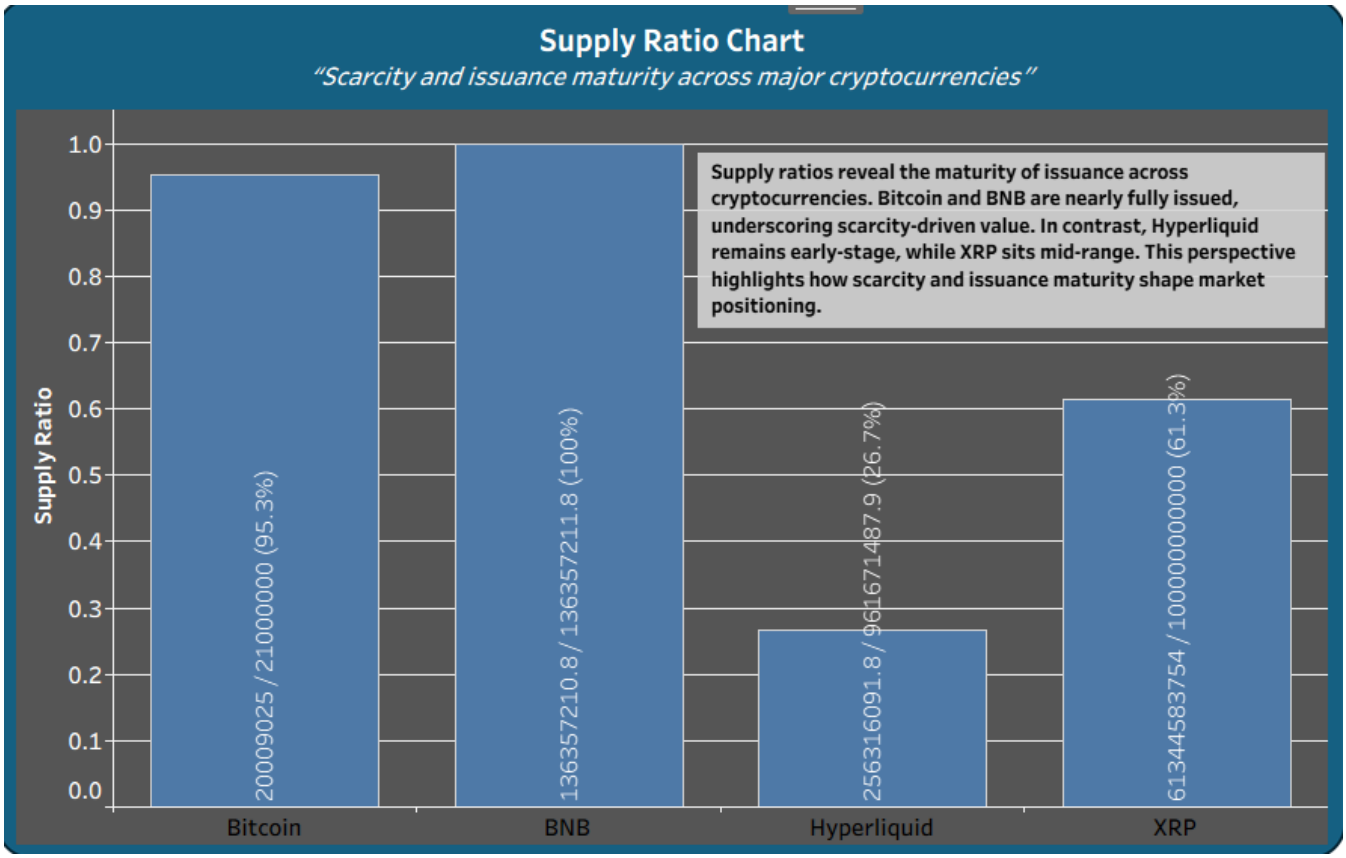
- Bitcoin (95.3%) is almost "sold out." This makes it Scarce and Stable, like digital gold.
- BNB (100%) is fully out, meaning no more new coins will ever "flood" the market.

The "In-Progress" Coin (XRP):

- XRP (61.3%) is in the middle. Most is out, but a good portion is still being released slowly over time.

The "Early Stage" Coin (Hyper liquid):

- Hyper liquid (26.7%) is the "baby" on the chart. Most of its supply is still locked up. This means there is high potential for growth, but also more new coins coming later.

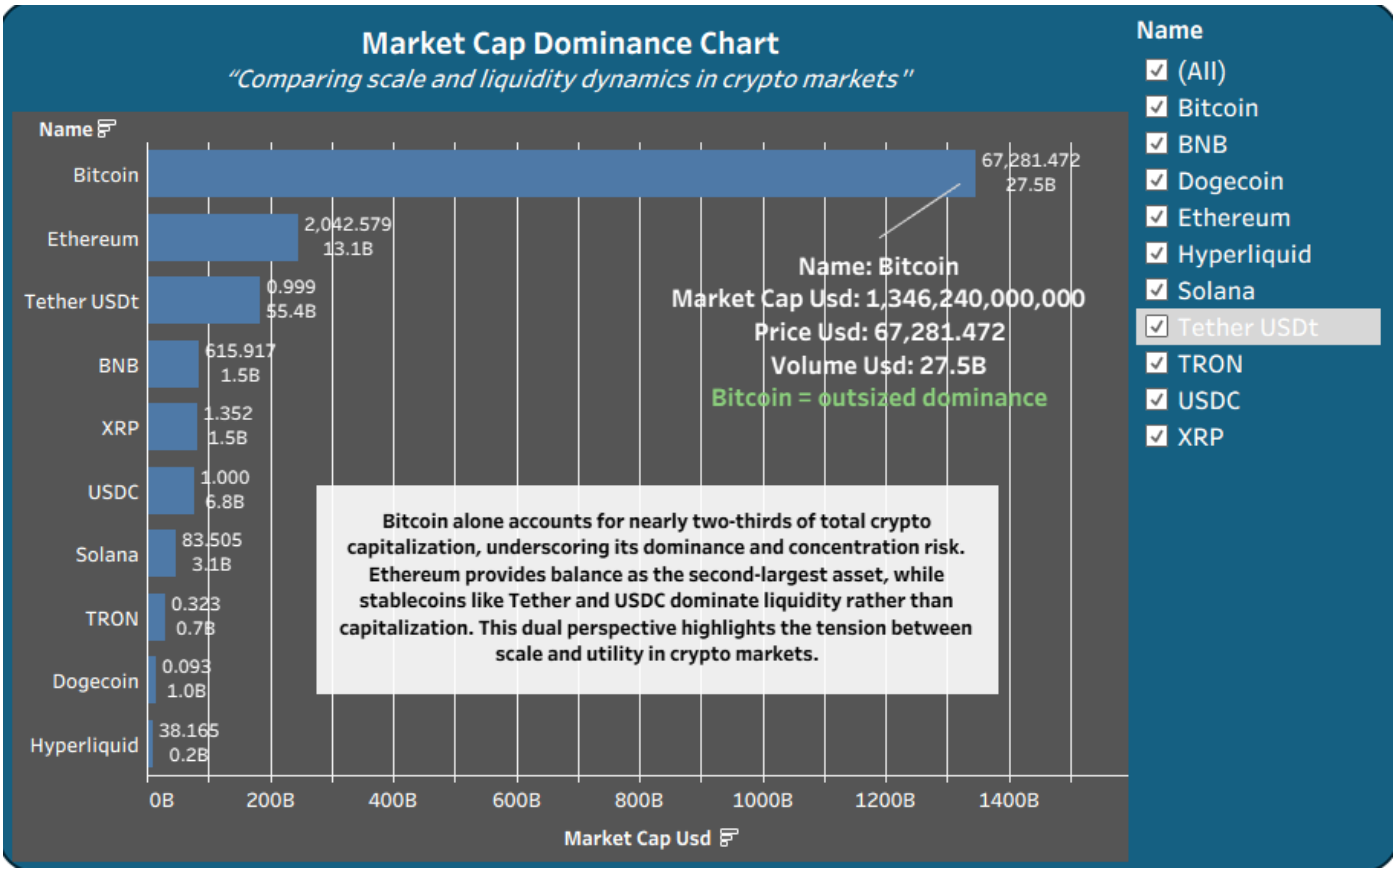


❖ "High percentage (Bitcoin) = **Scarcity and Safety.** Low percentage (Hyperliquid) = **Early-stage Growth.**"

Market Cap Dominance Chart

"Comparing scale and liquidity dynamics in crypto markets "

- **The Giant (Bitcoin):** Bitcoin isn't just the leader; it is larger than all the other coins combined. It holds nearly **two-thirds** of the entire market's value, making it the primary "anchor" for all investors.
- **The Second Pillar (Ethereum):** Ethereum stands as the clear number two. It provides the balance and infrastructure for the rest of the market.
- **The "Invisible" Power (Stablecoins):** Look at **Tether (USDT)** and **USDC**. Their bars are small because their price is always $1, but they are the most important for **liquidity**. They are the "cash" people use to buy and sell everything else.
- **The Altcoins (Solana, BNB, etc.):** These represent the specialized parts of the market—faster technology or specific ecosystems—but they are still much smaller than the "Big Two."

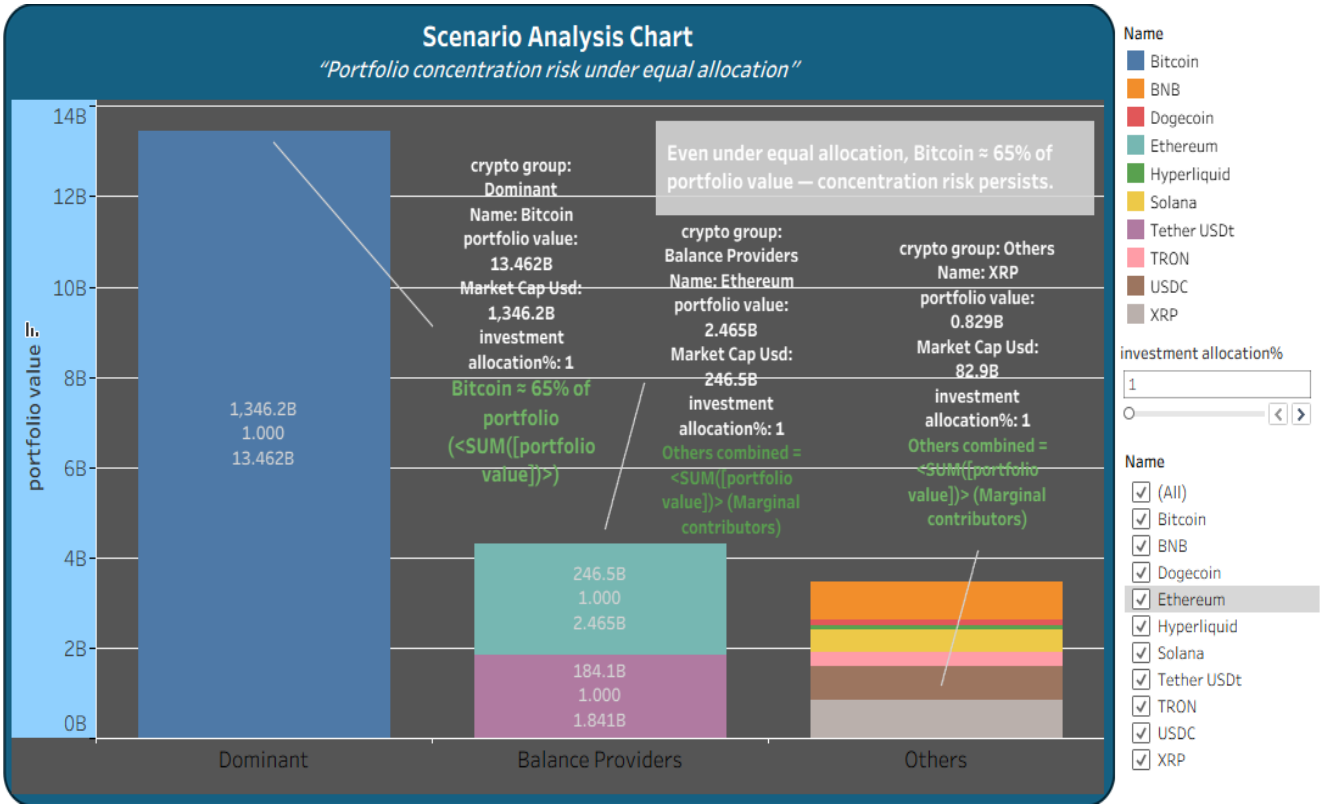


❖ This chart shows that while there are thousands of coins, the market is still **highly concentrated** in Bitcoin. It is a story of **Scale** (Bitcoin) vs. **Utility** (Stablecoins).

Scenario Analysis Chart

"Portfolio concentration risk under equal allocation"

- The Bitcoin: Even with an "equal" investment across all coins, Bitcoin still makes up 65% of the total portfolio value. It is so massive that it towers over everything else.
- The Balance (Ethereum): Ethereum acts as a secondary pillar, but it is still much smaller than Bitcoin in terms of total impact.
- The Rest (Others): All the other coins (Solana, Dogecoin, etc.) combined are just a small fraction of the total value.



- ❖ "Equal investment does not mean equal risk. Because of its sheer size, Bitcoin still drives the entire portfolio."

❖ Diversity is not the same as Safety. Even with equal market investment, Bitcoin drives 65% of this portfolio. Altcoins add growth potential, but risk remains tied to the leader. Today, I've mapped your Scarcity (Bitcoin), Utility (Stablecoins), and Risk (Concentration). The next step is moving from passive holding to active management for stronger returns.

❖ I've built a Strategic Roadmap to address your portfolio's risks. Beyond charts, I deliver monthly optimization that keeps your assets working harder with less exposure. Let's schedule a quick 10-minute session next week to review my tailored Risk-Adjusted Rebalancing Plan.
